

# Fast-Track Deployment

Launch Mendix on Azure in 30 Minutes

Mendix on Azure is a managed solution in your Azure environment that configures, manages, and operates all the services needed to deploy Mendix applications on Azure.

Running Mendix applications in a production environment on your own Azure infrastructure requires a significant technical setup. Without Mendix on Azure, you'll need to configure and manage systems including:

Azure Kubernetes Service (AKS)

Azure Container Registry (ACR)

Database Service

File Storage Service

Monitoring and Alerting Systems (e.g., Grafana, Prometheus)

DNS and Certificates

Mendix Operator and Agent

These components require specific configurations for optimal performance with Mendix applications. This setup typically involves collaboration across multiple teams (infrastructure, database, DNS, security, architecture, and development) and requires approximately 140 hours of technical effort for initial setup, plus 8 hours per quarter for updates and maintenance.

For first-time users, the process can be prolonged due to organizational silos, competing backlogs, and lengthy architectural discussions due to the technical flexibility of the Mendix platform. These delays postpone application deployment and delay business value realization.

## How Mendix on Azure simplifies this process

Mendix on Azure is a fully managed service that eliminates the complexity of deploying Mendix applications on Azure. By leveraging Azure Marketplace capabilities, Mendix configures, manages, and operates all the necessary services on your behalf.

**Deployment Time:** Set up Mendix applications in your Azure environment in 30 minutes, not months.

**Configuration:** Azure best practices and Mendix-specific configurations are applied automatically.

**Updates:** Quarterly updates are automated, ensuring security and compliance with minimal effort.

**Effort Reduction:** Avoid the 140+ hours of setup time and ongoing maintenance burden.

## Why it matters

By eliminating manual setup and maintenance, Mendix on Azure allows your teams to:

- Focus on developing business value instead of configuring infrastructure.
- Avoid delays caused by cross-team dependencies or architectural discussions.
- Accelerate time-to-market for critical applications.

## Get started today

Experience a simpler way to deploy and manage Mendix applications on Azure. Reduce operational complexity and deliver better results faster with Mendix on Azure.
